Chem. 2440 HW \# 4
Assigned Feb. 10, due Feb 23.

1. Prove that the probability distribution $\mathrm{p}_{\mathrm{i}}$ that maximizes the entropy for die rolls subject to a constant value of the second moment $\left\langle i^{2}\right\rangle$ is Gaussian. (Here $i$ refers to the numerical values on the faces of the die.)
2. Problem 6-21 from McQuarrie
3. Problem 4-9 from McQuarrie.
4. For a thermodynamic system with three states you measure the populations $\mathrm{p} 1=0.90$, $\mathrm{p} 2=0.09$, and $\mathrm{p} 3=0.01$ at $\mathrm{T}=300 \mathrm{~K}$. What are the energies of the $2^{\text {nd }}$ and third states relative to the ground (1) state?
