## Exam 1 - MATLAB

Name: $\qquad$

1) (20 Points) Show the screen display for the following script and associated function in the space provided.
```
% script
    a=8
    b}=
    [g,h] = q1a(b,a)
```

function $[a, b]=q 1 a(g, h)$
$a=2 * h ;$
$\mathrm{b}=3 * \mathrm{~h}-\mathrm{g}$;

Show the screen display for the following script and associated function in the space provided.
\% script
$a=6$
$\mathrm{b}=3$

$$
[a, b]=q 1 b(a, b)
$$

```
function [g,h] = q1b (h,g)
    m = 3*h
    n = 2*h-g
```

2) (20 Points) Show the screen display for the following MATLAB code in the space provided.

```
h = 4;
for (k = 2:2:20)
    if ( k==6 | k<4 )
        newk = k+2;
        fprintf('\n%.2f', newk)
    elseif ( k<=12 & k>8 )
        h = k*2;
        fprintf('\n%.2f', h)
    elseif ( k==10 | k==12)
        h = k;
        fprintf('\n%.2f', h)
    elseif ( k>18 )
        h = h-1;
        fprintf('\n%.2f', h)
    end %if
end %for
fprintf( '\ndone' )
```

3) (20 Points) Show the screen display for the following MATLAB code in the space provided.

```
w = 0:4
for ( h = 5:-1:1 )
    switch (h-1)
        case {2,4}
            w(h) = w(h)+ w(h-1);
        case {3,1}
            w(h) = aa + 1;
        otherwise
            w(h) = h;
    end %switch
    aa = w(h)
end %for
```

Name: $\qquad$
4) (28 Points) For each of the following types of fit to an ( $x, y$ ) data set ( $\mathbf{x}$ vector of $x$ points, $y$ vector of $y$ points) identify the appropriate equation, $y=f(x)$, and MATLAB commands to produce the requested plot or fit to the data set.

| (a) exponential |  |
| ---: | ---: |
| equation: |  |
| semi-log plot command: |  |
| polyfit command: |  |
| equation: |  |
| (b) linear plot command: |  |
| polyfit command: |  |
| equation: |  |
| x-y plot command: |  |
| (c) power law |  |
| log-log plot command: |  |
| polyfit command: |  |
| polyfit command: |  |
| (d) polynomial of degree $\mathbf{N}$ |  |
| equation: |  |

## Name:

5) (12 Points) As a member of a software development team, you have been given the task of creating a function that will ask the user for a file containing an augmented coefficient matrix that describes a linear system of equations, load the file, and return the extracted coefficient matrix and rhs vector from the file to the workspace.
(a) What information (data) does the function need (require) from the workspace?
(b) What information (data) returns to the workspace?
(c) Write a function prototype.
(d) Write the MATLAB code to perform the required task (you can ignore header info \& variable dictionary).
